# SOFE 4640U Lab 2

## Simple Task - 2 Screens

## Prepared by: Kyle Siwazalian (100922895)

## Github Link: https://github.com/KyleSiw/SOFE4640U-Lab2

My main screen.

```
        btnNew.setOnClickListener {

            val intent = Intent( packageContext = this, cls = NewTask::class.java)

            startActivity(intent)

        }

    }
}
```

My main kotlin file, code to send the app to the newTask screen.

My newTask screen.

```
        doneBtn.setOnClickListener {

            if (titleView.text.isNullOrBlank()){
                Toast.makeText( context = this, text = "Please enter a title for your task.", duration = Toast.LENGTH_SHORT).show()
            }
            else{

                Toast.makeText( context = this, text = "Task Saved!", duration = Toast.LENGTH_SHORT).show()

                val intent = Intent( packageContext = this, cls = HomeScreen::class.java)

                startActivity(intent)

            }

        }

    }
}
```

My newTask kotlin file, code to save and send back to home.

These code files were made using button listeners and the transfer between screens uses intents.

There is no functionality for the saving of new tasks, as that will be completed in future labs.
